

The Inevitable Policy Response

The Investor Brief
Preparing Financial Markets

Consortium partners

This report was prepared by Vivid Economics and Energy Transition Advisors, who bear sole responsibility for any views expressed, which do not necessarily reflect those of the sponsors or other consortium members. The authors are solely responsible for any errors.

This project was commissioned by the PRI with support from:

Lessons from Covid-19

- As demonstrated by COVID19, large systemic environmental risks like Climate Change warrant serious investor attention.
- Stimulus packages in the next year may well effect these climate policies.
- Financial impacts under a more forceful IPR response to a major set of climate impacts could be as large and non-cyclical..

THE IPR ELEMENTS

The IPR Adoption Model

What is priced into markets today?

- The risk wasn't priced in in 2015 and Fossil Fuel free index has outperformed MSCI ACWI.
- We use a baseline of IEA STEPS for what is priced into today's markets – existing government commitments
- Discounting and acknowledged market behaviours drive short term horizon on transition risk
- Markets see transition risk as status quo but are already producing unpriced impacts eg: German utilities

MSCI ACWI EX FOSSIL FUELS INDEX (GBP)

The MSCI ACWI ex Fossil Fuels Index is based on the MSCI ACWI Index, its parent index, and includes large and mid-cap stocks across 23 Developed Markets (DM) and 26 Emerging Markets (EM) countries*. The index represents the performance of the broad market excluding companies that own oil, gas and coal reserves. It is a benchmark for investors who aim to eliminate fossil fuel reserves exposures from their investments due to concerns about the contribution of these reserves to climate change. The Index is a member of the MSCI Index Family.

Investors acknowledge that there will be a policy response, and that it will be delayed and disruptive

Nb: Polls now say a close run race

Any single factor could drive the market repricing point but together they form a powerful case for 2025

Example of how the acceleration and tipping point drivers interact

Interaction of drivers towards tipping point

For Sophisticated Investors, the range of IPR Probability is important

Once the tipping point is reached – What Policy Levers?

Once governments are forced to act, these are the likely key policies

Coal phase-outs

- Early coal phase-out for first mover countries by 2030
- Steady retirement of coal-fired power generation after 2030 in lagging countries

ICE sales ban

- Early sales ban for first mover countries by 2035
- Other countries follow suit as automotive industry reaches tipping point

Carbon pricing

- US\$40-80/tCO₂ prices by 2030 for first movers
- Global convergence accelerated by BCAs to ≥\$100/tCO₂ by 2050

CCS and industry decarbonisation

- Limited CCS support in power
- Policy incentives primarily for industrial and bioenergy CCS
- Public support for demonstration, and then deployment of hydrogen clusters

Zero carbon power

- Significant ramp-up of renewable energy globally
- Policy support for nuclear capacity increase in a small set of countries, nuclear managed out elsewhere

Energy efficiency

- Increase in coverage and stringency of performance standards
- Utility obligation programs,
- Financial and behavioral incentives

Land use-based GHG removal

- Strong policy support for re/afforestation
- Stronger enforcement of zero deforestation
- Controlled expansion of bioenergy crops

Agriculture

- Technical support to increase agricultural productivity
- Increasing public investment in irrigation and AgTech
- Incremental behavioural incentives away from beef

Carbon pricing – How the world will act

Country / region	Forecast Policy Response	
Tier 1 — Western Europe — Eastern Europe — Canada — China — United States	Early, high CO2 pricing	— US\$60 by 2030 — US\$100 by 2040 — Incentives to accelerate convergence: border carbon adjustments (BCAs), technology transfers, trade tariffs and financial support from the Green Climate Fund
Tier 2 — Australia — India — Japan — South Korea — Mexico	Early, medium CO2 pricing	— US\$40 by 2030 — Tier 2 to converge to Tier 1 by 2040
Tier 3 — Central and South America — Other developing Asia — Former Soviet Union — Middle East — Africa	Early, low CO2 pricing	— US\$25 by 2035 — Tier 3 to converge to Tier 1 by 2050

Countries with carbon pricing mechanisms already in place, who have started their energy transition and have high levels of climate ambition

Countries with emerging carbon pricing initiatives, for which international power plays are expected to play a key role, or which are likely to receive support from the EU

Countries which will give priority to socioeconomic development and might start with limited ambition

What macro outcomes result?

Major macro outcomes

.....

Deep and rapid changes in the energy system

- Oil to peak in 2026-28
- Thermal coal virtually non-existent by 2040
- Solar and wind generating approximately half of all electricity in 2030

Transport electrified inside 20 years

- ICE sales bans, supported by falling cost of EVs, drive rapid deployment of ultra-low emissions vehicles
- Making up almost 70% of passenger vehicles by 2040

Major changes in land use

- Deforestation virtually eliminated by 2030, with pressures on supply chains
- Large opportunities to invest in nature-based solutions

Rapid reductions in carbon emissions, but not enough to hit 1.5°C

- > 60% fall in global CO₂ emissions by 2050
- New innovative policy and industrial solutions, not yet proven or achieved at scale, are needed to achieve 1.5°C

Reaching a 1.5 degrees outcome is a far bigger challenge – but should remain the Aspiration

Achieving the 1.5°C target will require accelerated and substantial effort across multiple emerging solutions to go further than IPR-FPS.

Not in Scope

IPR current
scope

The value streams capture the dynamics of the transition, which affects production costs directly through carbon pricing and indirectly through demand changes

The demand creation value stream captures the effects of **increasing demand for low emissions products or inputs** (such as EVs, copper and renewable energy equipment).

These impacts will depend on **a company's current and future share of green markets**, and the extent of **overall market growth**.

Demand
destruction

The demand destruction value stream captures the impact of the **contraction in demand for high emissions products** due to climate policy (such as ICEs and fossil fuels).

These impacts will depend on a company's sensitivity to falling **commodity prices and margins**, which will be tied to **production horizons and cost structures**

Demand
creation

Cost and
competition

Cost and competition captures the **carbon costs companies face directly from Scope 1 emissions**, and **indirectly through power prices**.

Impacts will depend on a company's **emissions intensity, abatement opportunities and capacity to pass through costs to consumers**, relative to competitors.*

Sectoral: Within-sector variation can be significant, particularly for the four most impacted sectors in the index: Energy, Consumer Cyclicals, Non-Energy Materials and Utilities

NB based on business models as at today

Quantitative Results: the big opportunities are by tilting portfolios towards greener options within asset classes – especially in green infrastructure

Investors can turn downside to upside, without changing the sector composition, by switching from high carbon* to green* securities

See separate presentation with quantitative results

What should investors do?

Investor Actions

Asset Owner IPR Mitigation Tasks

Engagement or Portfolio construction strategy?

- The two pillars of climate mitigation strategy will become intertwined in some asset classes especially public markets.
- An engagement philosophy is to engage companies to make their strategies reflect the energy transition. This does not require active portfolio reconstruction as the risk is transferred to the company to manage if it can be effective before the tipping point.
- For some asset owners, capital recycling into low carbon assets themselves might seem more attractive than betting on high carbon companies acting fast enough, particularly with only a short time to 2025 to see real transition and with few having shown urgency.
- Rewarding and incentivizing companies to create credible transition strategies. Using forward looking company plans to assess valuation will become key.

The focus of this paper is on portfolio action.

Asset Owner Thematic Strategy

KEY CONCLUSIONS: Asset Allocation and Capital Recycling - illustrative impact

Before

After

{This includes companies in transition}

\$\$\$allocation

Traditional SAA v Total Portfolio Approach / Flexible Constructions

Traditional SAA	Total Portfolio Approach/Flexible Constructions
Well established but increasingly seen as inadequate for modern markets and themes	Requires more judgement, more detailed risk analysis, more thematic, e.g. carbon transition
Historical data used mostly, can look forward	Forward projections used
“Safe” space for investment consultants	Mercer / Towers advocates new approaches
Low career and reputational risk for CIOs	High reputation and career risk but higher reward if correct
May miss the carbon transition completely	Can be based around themes like IPR
Long cycles for re-iteration	Far more dynamic and real time
Requires little change	Requires significant change – new capacity, new governance decisions
Portfolio plays “catch up” on new opportunities	Portfolio anticipates and maximises new opportunities e.g. natural assets, transition bonds etc
Risk = volatility	Risk defined more broadly and managed in far more holistic manner

Maximising Thematic Climate risk approaches across asset classes

Asset Class	Consideration
Equities	New benchmarks around IPR. Consider increase in active allocation. Engage with asset managers and companies.
Fixed Income	Active position on corporate debt, New green bond indices. Transition bonds. Identify worst sovereign risks. Engage heavily with ratings agencies
Infrastructure	Allocate to value add buckets
Private Equity	Creative deals, delist companies for transition, bring companies to market
Real Estate	Driver clean REITs, tilt unlisted towards green.
Real Assets	Forestry, nature based assets a huge opportunity

Note: Seeking thematic exposure to agriculture changes essential across all asset classes

Capital Recycling – how far should investors go?

	Very Active – High Capacity Required	Partially Active
Equities	• Ignore tracking error • Reduce equity allocation considerably • Screen out energy stocks entirely • Screen out negative return stocks • Reallocate significant passive equities to active mandates with a transition theme. • Re-allocate high carbon equities to low-carbon assets in alternatives. • Lower targets for sector and regional diversity	• Maintain some tracking error against broad index • Reweighting of exposed companies • Smaller reduction in equities • Screen out 75th or 90th percentile worse expected performers in all sectors • Reallocate partially to alternative asset classes • Retain some sector diversity • Retain some regional diversity
Fixed Income	Same as equities for corporate debt. Screen out high carbon countries from sovereign debt	Some screening
Infrastructure	Major reallocation to value add buckets. Lower infrastructure index exposure. Engage with asset managers on clean indices	Re-allocate within existing SAA ranges
Real Estate	Make whole real estate allocation low carbon and increase allocation. Tilt REITs away from exposures.	Set guidance for real estate acquisition
Private Equity	Structure PE mandates around IPR. Seek large creative deals to take advantage of possible restructuring of some large companies.	Engage with General Partners

Asset Owners recycling capital across the Investment Chain

IPR Early Adoption – what does it mean?

1. Feedback on IPR assumptions
2. Public acknowledgement and support for the IPR framework and concepts
3. Full or partial Implementation of IPR through engagement and / or portfolio constructions
4. Further feedback on implementation barriers

APPENDICES

Company outputs from the Forecast Policy Scenario modelling

Outcomes for companies are driven by the IPR Forecast Policy levers*, particularly the coal and ICE phase-out, carbon pricing and zero-carbon power

Company (anonymised)	Description	Coal phase-out	ICE sales bans	Carbon pricing	CCS and industry decarbonisation	Zero-carbon power	Energy efficiency	Land use-based greenhouse gas removal	Agriculture
 A	Utility (primarily renewable generation)	✓	(✓)	✓	X	✓	(✓)	X	X
 B	Utility (primarily coal generation)	✓	(✓)	✓	X	✓	(✓)	X	X
 C	Integrated Oil & Gas	(✓)	✓	✓	✓	(✓)	(✓)	X	X

Indirect effect through demand for electricity

Indirect effect through demand for power

Indirect effect through demand for gas power

Indirect effect through demand

The value streams capture the dynamics of the transition, which affects production costs directly through carbon pricing and indirectly through demand changes

The demand creation value stream captures the effects of **increasing demand for low emissions products or inputs** (such as EVs, copper and renewable energy equipment).

These impacts will depend on **a company's current and future share of green markets**, and the extent of **overall market growth**.

The demand destruction value stream captures the impact of the **contraction in demand for high emissions products** due to climate policy (such as ICEs and fossil fuels).
